Project Title – MindSpace: Mental Health & Wellness Portal

MindSpace is a frontend-only web portal developed to raise mental health awareness and offer users accessible, self-help tools to manage stress, anxiety, and emotional well-being. This platform is designed to provide a calming and private space where users can reflect, relax, and explore mental wellness resources without the need for login, registration, or any backend connection.

The project addresses a real-life issue: many individuals feel hesitant or uncomfortable seeking mental health support due to stigma or lack of awareness. MindSpace aims to reduce this barrier by creating a friendly and interactive environment where users can engage with wellness tools in their own time and space. The client side includes pages like a soothing home page, a self-help section with features such as a journaling tool and guided breathing exercise, a mood tracker with visual feedback, educational blogs, a session booking form, and a contact or feedback page. The admin side simulates a dashboard for psychologists or content managers, allowing them to add or edit blog posts, review session requests and user feedback, and manage the visibility of wellness tools — all implemented using frontend technologies and dummy data.

The portal also includes thoughtful features such as daily affirmation popups, light/dark mode toggles for accessibility, goal-setting and habit-tracking tools, and multi-language interface options. To support mindfulness, it even offers guided meditation videos embedded directly into the site.

Built using HTML, CSS, Tailwind and JavaScript, MindSpace blends calming design with meaningful functionality, making it a socially relevant and creatively strong project .
